

F-you, F-me, fNRB!

Let's talk about modeling woodfuel-landscape dynamics

ETHOSCon Jan 27-28 2024

Wood harvesting and land cover change

Charcoal awaiting transport to Nairobi

Nearly all landscapes produce a measurable increment of woody biomass. If wood is extracted in excess of that amount, stocks decline and demand is **unsustainable**.

This is how we define “**Non-renewable biomass**” (NRB)

The ratio of **NRB** to consumption is “**fNRB**”
fNRB helps us estimate CO₂ emissions from woodfuels and quantify ERs from interventions

Leleshwa (T. Camphorata) after harvesting for charcoal (Narok, Kenya)

Miombo Forest, Kasungu National Park, Malawi: CC-BY-SA-3.0,2.5,2.0,1.0

How we model fNRB?

We use 3 or 4 key parameters:

1. Woodfuel consumption

- Who uses it?

- Where are they?

- How much do they use?

2. Tree extent and growth rates

3. Accessibility

4. Other drivers of deforestation, degradation, and tree loss

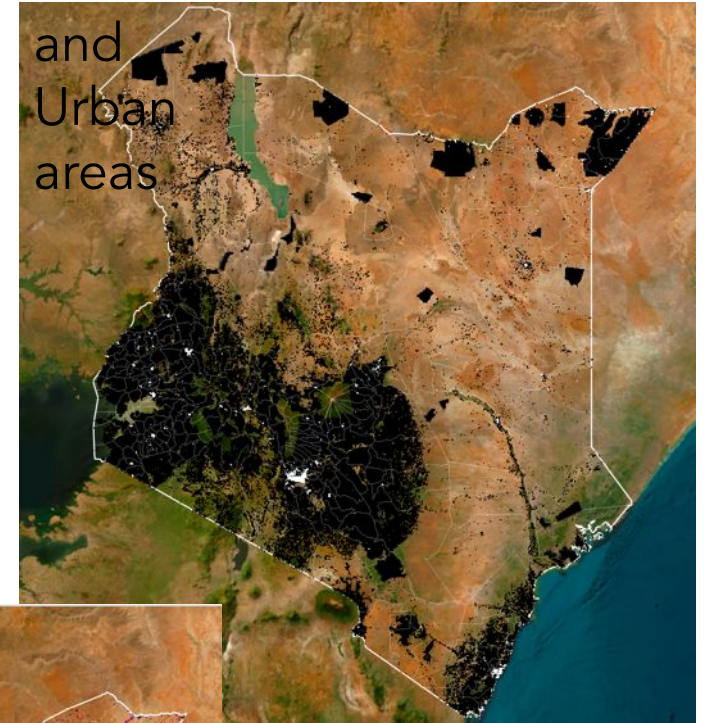

Who uses which fuel and where?

No. of fuel users in KEN under BAU (thousands)

ation
densit
y

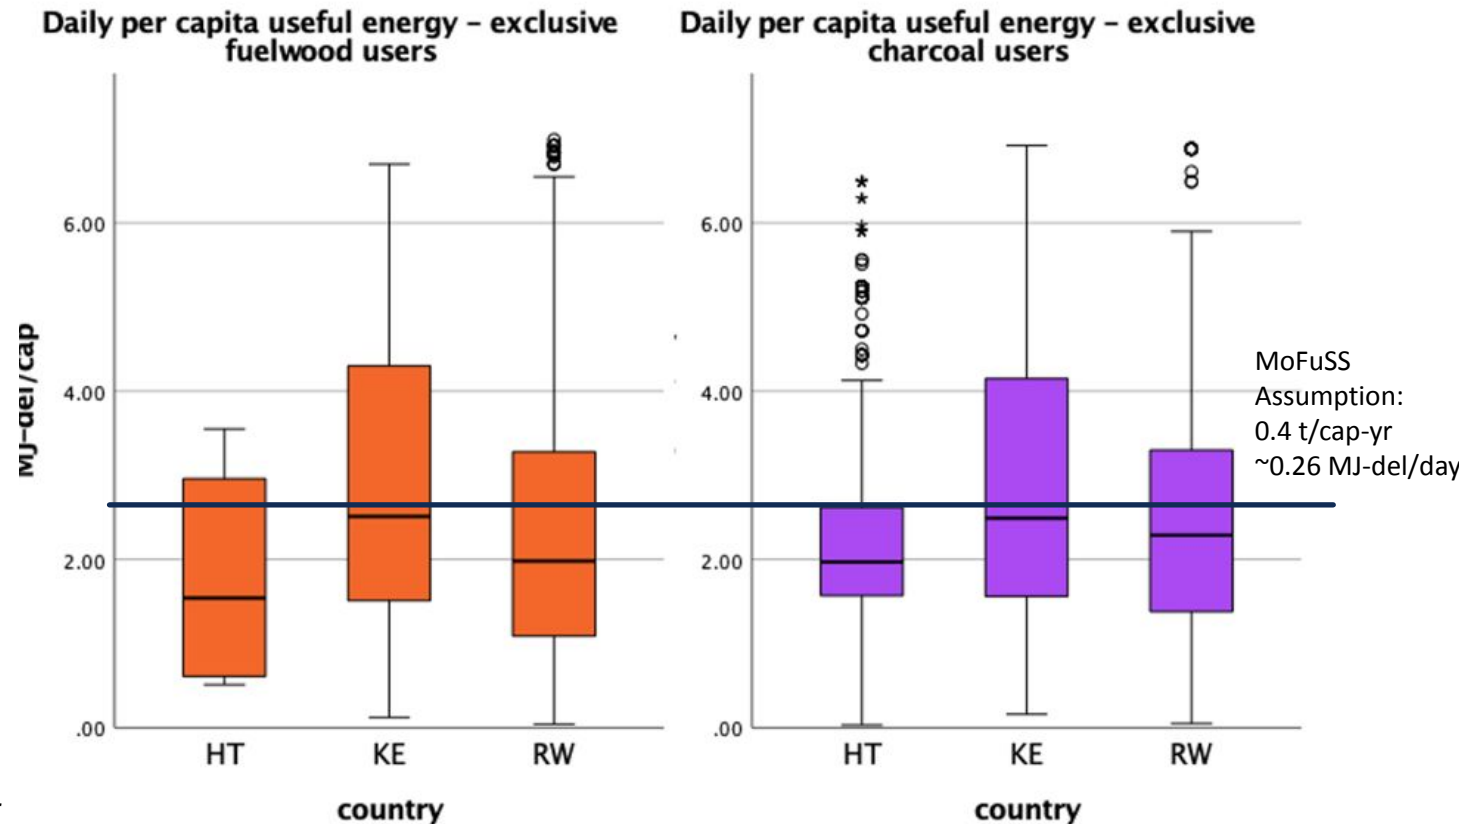

How much fuelwood and charcoal do people use?

Country-specific averages compiled by UNFCCC

	UN and DHS		PDD values	
Region	No.	<u>tpc/yr</u>	No.	<u>tpc/yr</u>
SSA	33	0.59	58	0.87
W Asia & N Africa	1	0.59	0	-
LAC	8	1.10	6	1.11
E Asia & Pacific	7	0.44	10	0.95
South Asia	5	0.57	35	0.40
Eur & Cent Asia	4	0.32	0	-
Total	58	0.62	109	0.74

Moisture content isn't specified, but assume "air dry", so "oven-dry" would be ~20% less

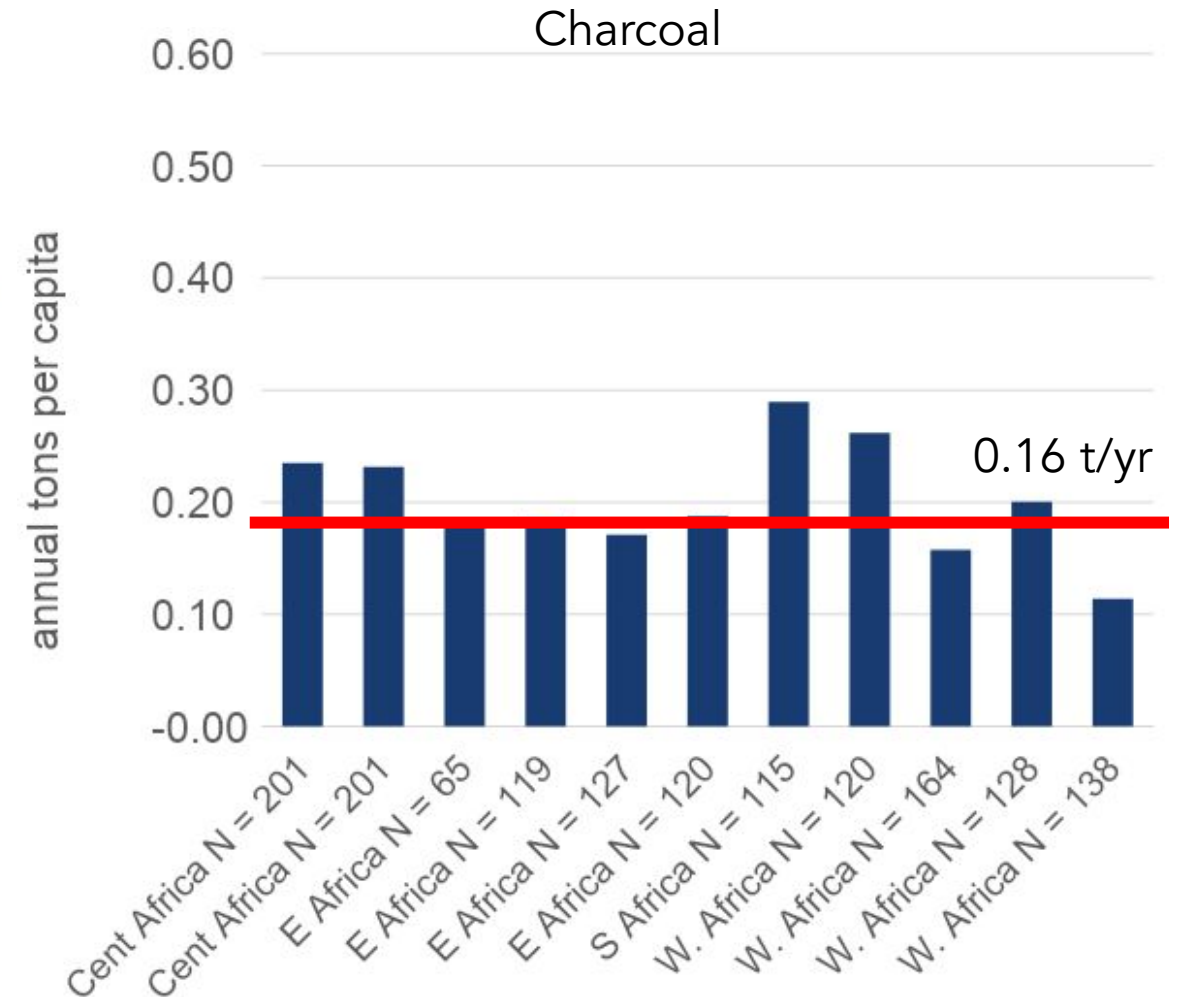

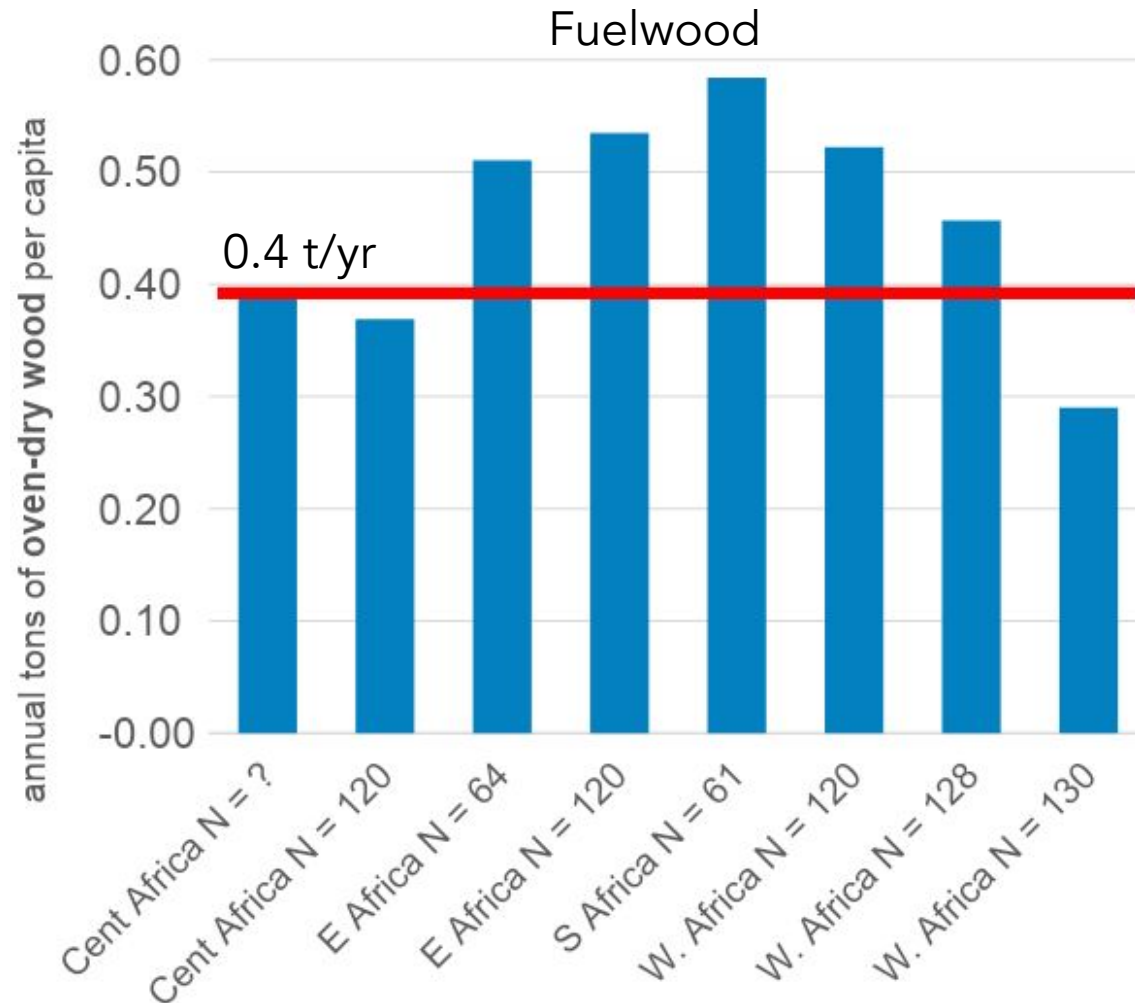

Useful energy equivalent to ~160 kg/cap-year of charcoal

Some public comments requested that we consider alternate values - more on this later

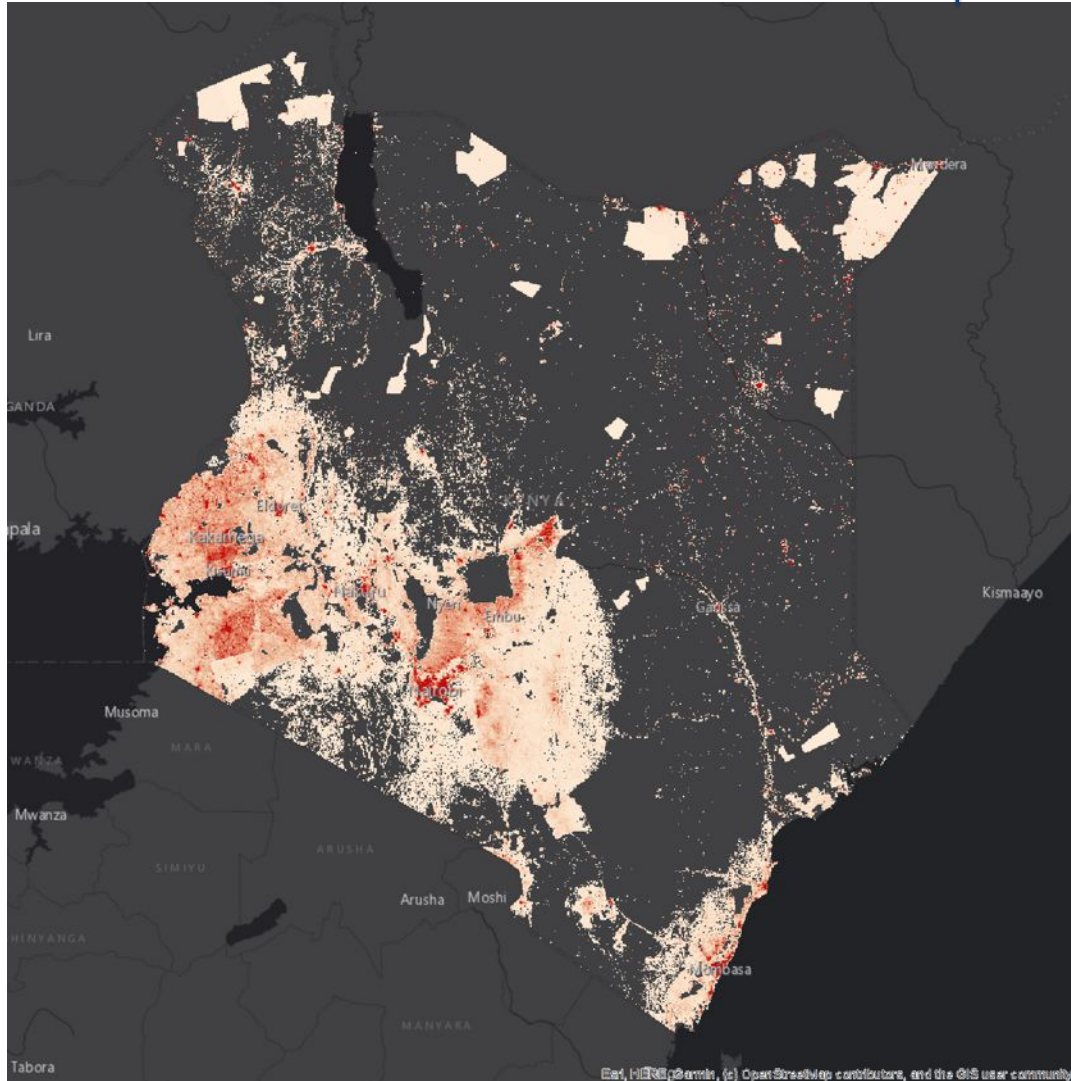

Comparing our assumptions field measurements...

Data from 19 KPT campaigns implemented in 9 SSA countries

Combined into annual wood and charcoal demand

Marketed fuelwood & charcoal consumption

Self gathered fuelwood consumption

Call for public input on the info note "Info note: Default values for fraction of non-renewable biomass (NRB)", (13 October 2023 to 31 January 2024, 23:59 CEST).

The Methodologies Panel (MP) is seeking inputs on the info note: Default values for fraction of non-renewable biomass (NRB)", as contained in MP 92 Annex 7. The work was carried out in response to the mandate from the Board at its 116th meeting (EB 116 meeting report, para. 25), which requested the MP to develop subnational/regional values of NRB, by building on scientific studies and engaging external experts. Stakeholders are invited to provide their inputs on the approach adopted and proposal for improvement in the commenting table which is [available here](#).

The call for inputs from stakeholders was open from 13 October to 10 November 2023, 23:59 CEST (now extended until 31 January 2024). The public inputs received will be considered by the MP for possible improvements to the work at its future meetings.

Public comments

46 submissions received to date. Points raised include:

- Accounting for non-residential demand
- Using more country-specific data
 - Fuel consumption
 - Stacking
- Questioned our choice of biomass stock and growth parameters

https://cdm.unfccc.int/public_inputs/2023/1310_01/index.html

Accounting for non-residential demand

- For commercial, institutional, and widespread cottage industries:
 - Impacts are spatially correlated with population distribution
 - Add a multiplier to residential demand
- For tea and tobacco
 - 6 countries – 90% of production in SSA
 - Impacts are localized - not based on popl'n

Non-residential demand

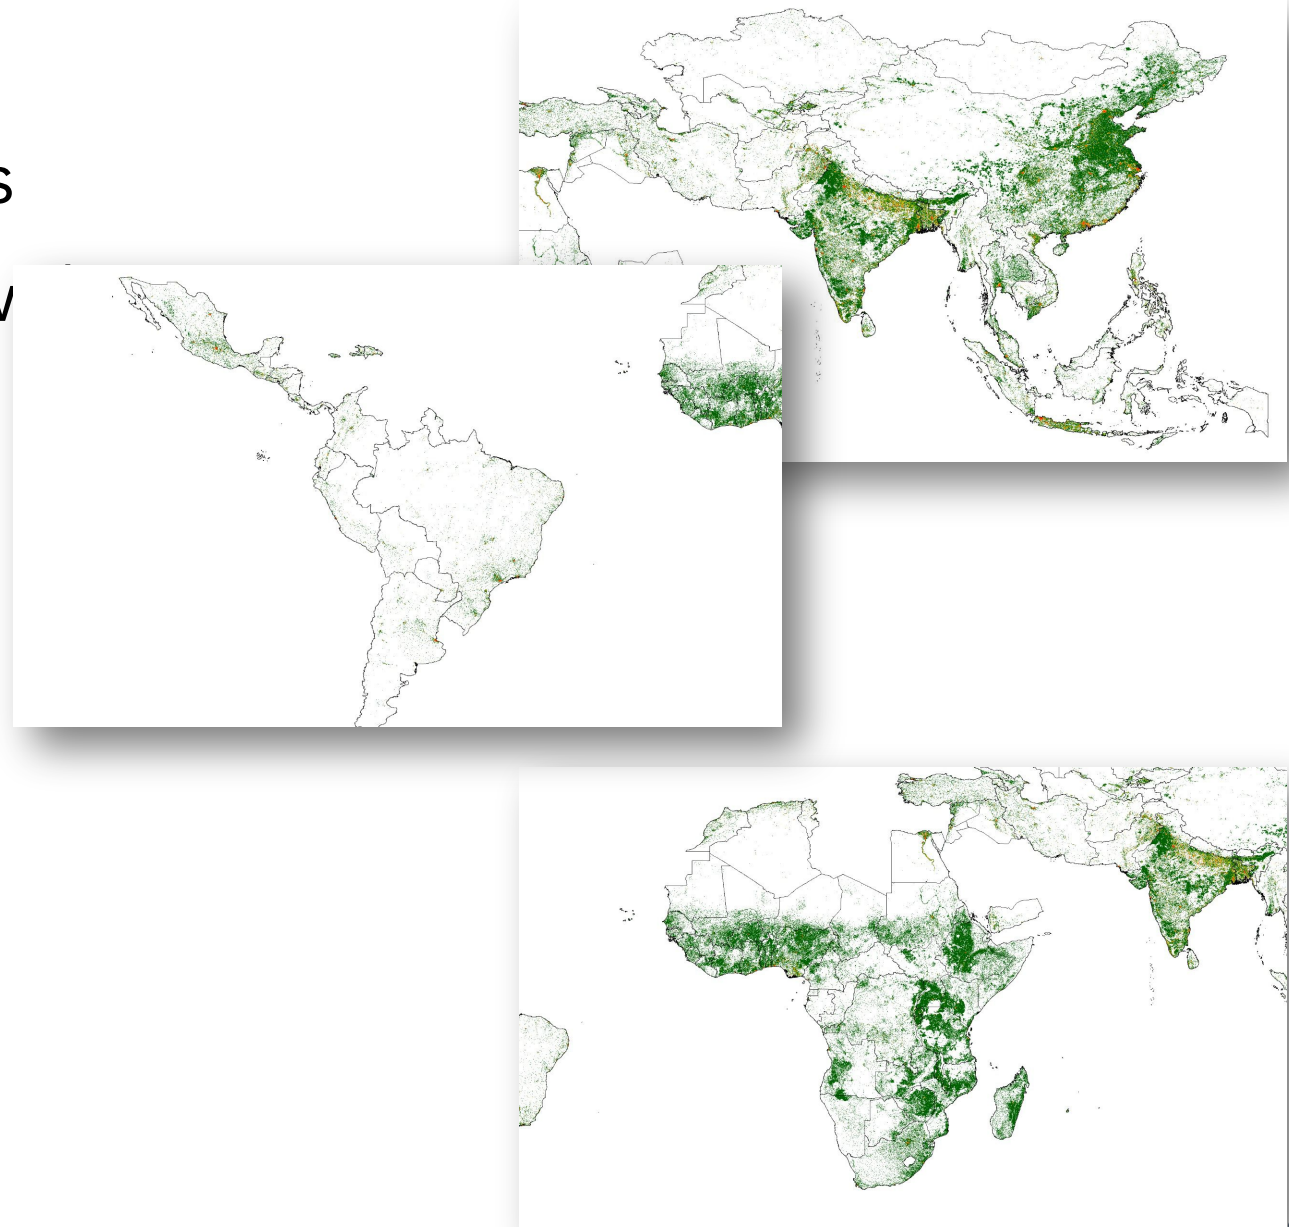

Non-residential woodfuel consumption as a percentage of residential consumption

Country	Fuel	Year	Institutions	Food vendors	Inst and restaurants	Tea	Tobacco	Bricks	Other industry	All industry	All non-residential	Source
Rwanda	Wood	2019	11.5%	1.6%	13.2%	0.3%		3.7%		4.0%	17.2%	a

Next steps

- Continue reviewing public inputs
- Rerun SSA model for UNFCCC w adjustments
 - Combine sub-regions (still debugging)
 - With commercial and industrial demand
- Run other regions
- Discuss with DNAs
 - UNFCCC-organized webinar next week
 - In-person visits to select countries Q1/2

Yes, trees grow in SSA (data from LANDSAT)

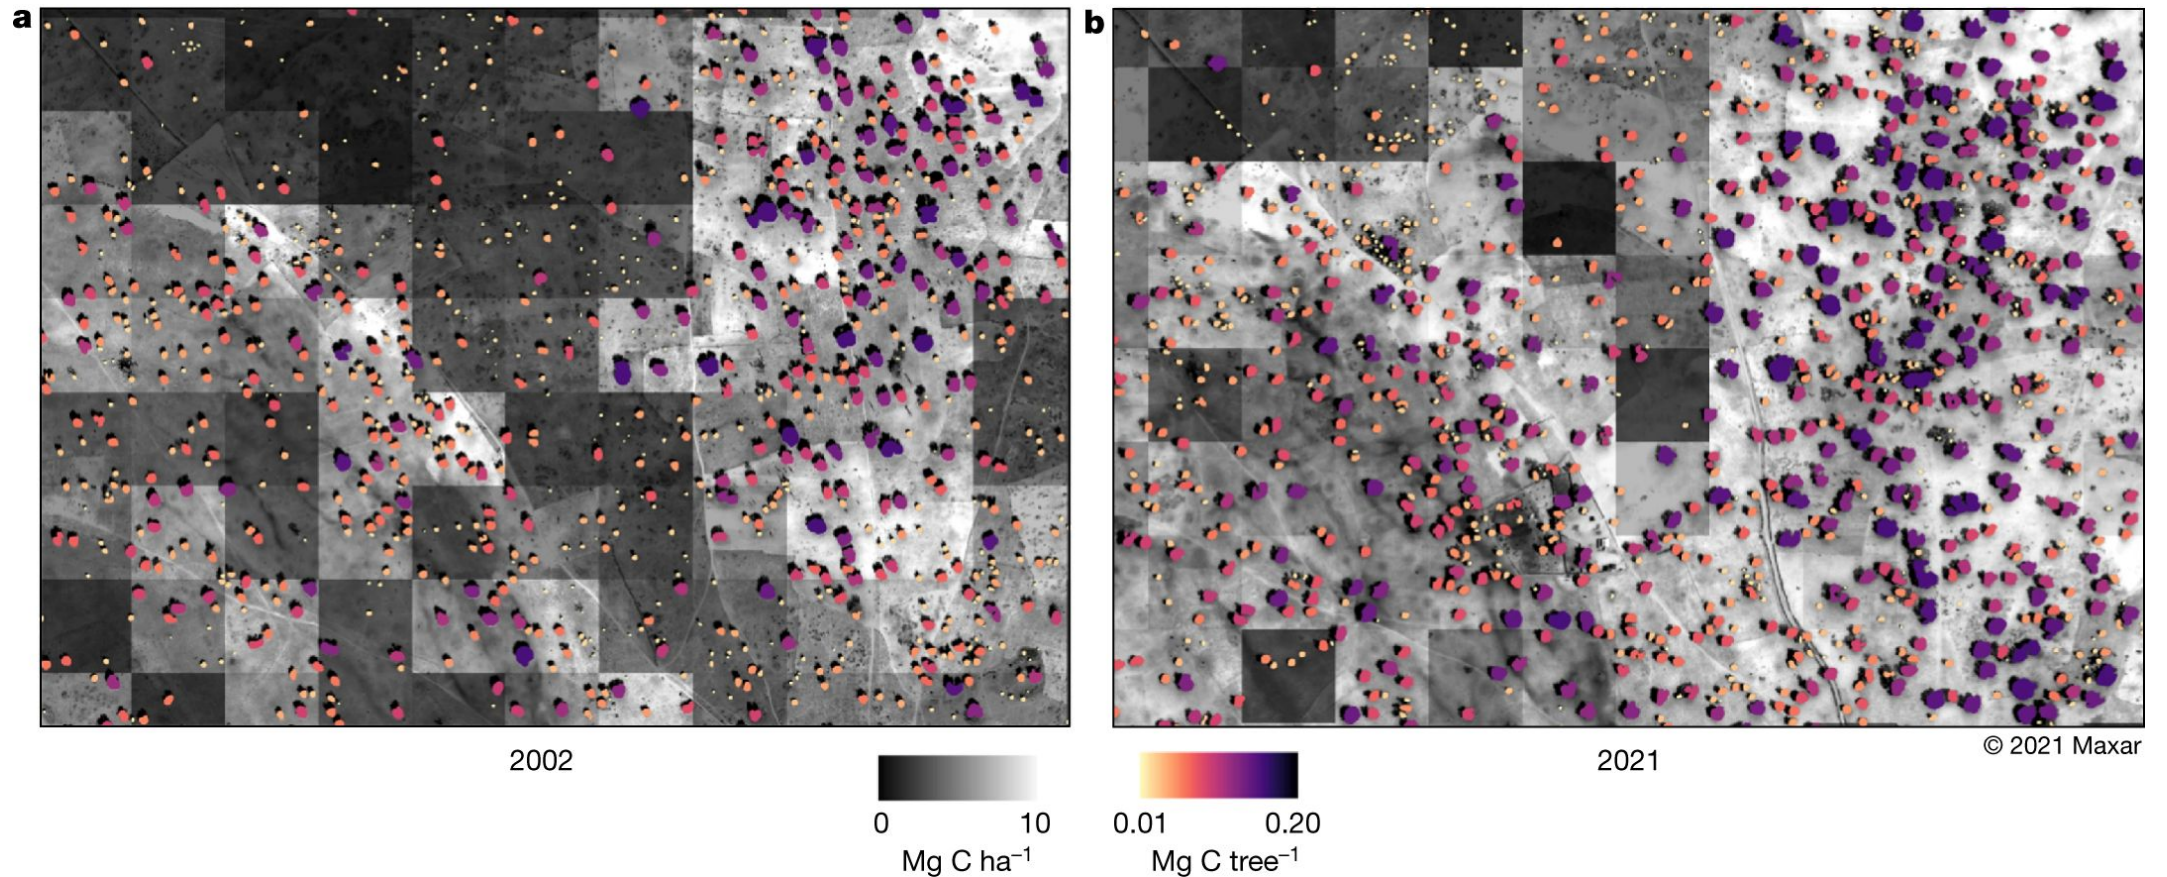

Yes, trees grow in SSA (data from ALOS-PALSAR)

Carbon stock changes due to deforestation, degradation and (re)growth, with the values is the losses bar showing the percentage contribution of deforestation and degradation to the total carbon losses . Error bars show the 95% confidence intervals (CIs) and represent for the total error on each bar (from <https://www.nature.com/articles/s41467-018-05386-z>).

Yes, trees grow in SSA (data from MAXAR analyzed with AI)

A 50-cm-scale image from 2002 (a) and a 50-cm-scale satellite image from 2021 (b) showing an agroforestry area at the same location. Tree cover has increased between 2002 and 2021 and the average carbon density of both areas was calculated and increased from 6 to 10 Mg ha⁻¹. A large number of trees grow on farmlands, keeping the soils fertile and reducing the need for fallow periods. The greyscale of the background images indicates the carbon density per hectare, whereas the colour scale shows the carbon content of individual trees. This is a good example of the tree restoration monitoring potential in our study area (from <https://www.nature.com/articles/s41586-022-05653-6>)

What is fNRB?

Conceptually, it's straightforward:

Imagine we have 1 hectare of healthy woodland

Trees growth at an annual rate that is equivalent to the woody biomass of 1 mid-sized tree

Today

What is fNRB?

Conceptually, it's straightforward:

Imagine we have 1 hectare of healthy woodland

se)

Summing up

50% fNRB

- Harvest is 2x the "sustainable" yield
- Harvest can continue for 15 years in our "model" *
 - Starting to harvest in Year-6, depletes stock in Year-21

90% fNRB

- Harvest is 10x the "sustainable" yield
- Harvest can only be sustained for ~2 yrs
 - Starting to harvest in Year-6, depletes stock by Year-8

* Depends on initial stock

Some issues with this

Growth rate depends on stock

- It's not constant
 - Closer to an inverse power relationship
(Growth \propto Stock^{-constant} between zero and one)
- Growth typically increases with minor disturbance
 - Less competition for water, light, & nutrients
- Trees are often pruned or coppiced
 - Regrow faster than from seeds or rootstock

Tree recovery in Miombo Woodlands

Challenges using Tool30 – misleading or ambiguous data sources

Data / Parameter table 5.

Data / Parameter:	<i>MAI_{forest,i}, MAI_{other,i}</i>
Data unit:	tonnes/ha/yr
Description:	Mean Annual Increment of woody biomass growth per hectare in sub-category <i>i</i> of forest areas in the relevant period Mean Annual Increment of woody biomass growth per hectare in sub-category <i>i</i> of other land areas in the relevant period
Source of data:	The following data source may be used: (a) Global Forest Resources Assessment 2000 by the FAO for "Distribution of total forest area by ecological zone" (Table 14); and/or (b) 2019 Refinement to the 2006 IPCC Guidelines for National Greenhouse Gas Inventories for "Above-ground biomass growth rates for different ecological zones" (Chapter 4, Table 4.9). Use a weighted average based on the forest area of three categories (i.e. primary forests, above and below 20 years secondary forests), if such data is available. Otherwise, use a simple average of the two age categories of secondary forests or a simple average of the three categories if primary forests exist; (c) Global Forest Resources Assessment (e.g. Table 17 "Net annual increment in forest 1990-2015" in 2015 version); (d) National studies or government data or official statistics. The most recent available data shall be used. However, the vintage of the above data shall not be before year 2000. It is required to determine MAI values for different sub-categories of forest areas and other land areas. However, in the absence of the local data in the country, global data (such as 2019 Refinement to 2006 IPCC Guidelines) or data of similar ecological zones in other regions may be used with due justification. Further, if the MAI value for other land areas is not available in a country while only the MAI value for forest areas exists, the MAI value for forest areas may be used as the MAI value for other land areas with due justification

e.g. FAO's GFRA only identifies a small area of Montane Forest in Rwanda as a potential source of wood, but 75% of Rwandans who collect fuelwood obtain it from private land and 88% travel less than 2km (MININFRA, 2020)

Challenges using Tool30 – misleading or ambiguous data sources

From IPCC's "2019 Refinement to the 2006 IPCC Guidelines for National Greenhouse Gas Inventories"

Domain	Ecological Zone ⁴	Continent	Status/ Condition	Aboveground biomass growth [tonnes d.m. ha ⁻¹ yr ⁻¹]	Uncertainty	Uncertainty type	References
	Tropical rainforest	Africa	Primary	1.3	3.5	SD	1, 2
			Secondary> 20 years	3.5	3.3	SD	3-8
			Secondary≤ 20 years	7.6	5.9	SD	3-7, 9
		North and South America	Primary	1.0	2.0	SD	2, 10, 11
			Secondary> 20 years	2.3	1.1	SD	3, 4, 12-15
			Secondary≤ 20 years	5.9	2.5	SD	3, 4, 6, 12-14
		Asia	Primary	0.7	2.2	SD	2, 16
			Secondary> 20 years	2.7	3.1	SD	3, 4, 17
			Secondary≤ 20 years	3.4	3.9	SD	3, 4, 17-19

Real data from *miombo* woodlands show (re)growth rates that are:

- Not constant
 - Higher in young stands
 - Very variable

Fig. 3. Wood biomass accumulation in regrowth *miombo* woodland under different management levels in Zambia: 1 (●) for pre-1980s characterized by good forest management ($y = 103.5 - 129.7 \cdot 0.94x$), 2 (○) for the 1980s characterized by declining forest management ($y = 27.5 \cdot \ln(x) - 37.0$) and 3 (◇) for the 1990s characterized by lack of forest management ($y = 15.7 \cdot \ln(x) - 27.0$).

Challenges using Tool30 – misleading or ambiguous data sources

From FAO's "2015 Global Forest Resource Assessment"

Net annual increment (m3 per hectare and year)	Total					contrib from conifers	contrib from broadleaf
	1990	2000	2005	2010	2015	2015	2015
Burkina Faso		1.2					
Equatorial Guinea	7.5	7.6	7.4	7.8	7.6	0	7.6
Ghana	4						
Kenya	3.5	3.4	3.3	2.8	3.3	2	1.3
Mali	0.9	0.9	0.9	0.9	0.9		
Mauritania					1.8	0	1.8
Swaziland	4.5	5.2	5.2	5	5.4	5.8	4.9
United Republic of Tanzania	2.5	2.5	2.5	2.5	2		

Take Kenya as an example:

- 1.3 m³/ha-yr for broadleaf forests
< Mauritania ?!?!
• 0.9 dry-tons/ha-yr
• lower than most IPCC data

Other sources have very limited coverage. E.g. FAO's 2015 GFRA:

- Only includes 11 countries in SSA
- Has no breakdown by forest type
 - Only conifer / broadleaf
 - Inconsistent presentation of data
 - No scientific sources cited
 - No uncertainty provided

Challenges using Tool30 – misleading or ambiguous data sources

IPCC (2019) default growth rates for forest types in Africa

Challenges using Tool30 – misleading or ambiguous data sources

Example from Malawi using inputs recommended by TOOL30 including:

- Forest areas from FAO's 2000 GFRA
- MAI's from IPCC 2019 guidelines
- Consumption from a registered PDD

fNRB varies from 87% to 28%
